ZINCA

A cold galvanizing compound is a high-quality solution that is perfect for touch-ups or full-scale project application. A cold galvanizing compound has the characteristics of a paint, but it's not a paint. The biggest difference is the percentage of zinc present in the corrosion prevention coating. In order to be a cold galvanizing compound you need an extremely high percentage of zinc dust in the dried film - greater than 95%. That's one of the secrets as to why the performance is equivalent to hot-dip galvanizing.
